

Uniqraft

From a customer's photo to a reviewed,
manufacturable product, made at a factory near
them.

THE PROBLEM

Custom products still break between the buyer and the machine

Uncontrolled input

A phone photo or a vague idea is not a file a laser, router or printer can run.

Manual translation

A designer redraws it, a shop quotes it, and proofs travel back and forth by email for days.

Preview is not product

What looks right on screen can fail on a specific machine, material and thickness, and someone pays for the remake.

THE SOLUTION

One loop from photo to delivered object

AI proposes the design. Deterministic templates decide what a machine can make.

A working product, live at uniqraft.org since July 2026

Image-to-SVG studio

Upload, chat, and watch a sanitized cutting file stream into a live preview.

Personalized night lights

Template-based personalization that ends in an orderable product.

Full commerce

Catalog, cart, checkout, orders and card payments through Ameriabank.

Built for many markets

Three languages, four currencies, availability and shipping rules by country and region.

Production review gate

Admins review every generated design before manufacturing, with an audit trail.

Partner workshop data

14 machines profiled at our partner workshop: CO2 and fiber laser, CNC router, flatbed UV, 3D printing.

TARGET CUSTOMER

People and businesses who need a custom physical product made from a photo, name or idea

First

Gift and home shoppers

Buy personalized night lights, wall decor, toys, constructors and banners for gifts, homes, kids and events. Today they choose between generic print-on-demand or slow email orders from a local shop.

Core repeat

Professionals who order for clients

Photographers, event planners, realtors and gift shops. One consumer buys once a year; a photographer with forty sessions a month orders every week.

Later

Merchants and workshops

Etsy and Shopify sellers of custom cut, engraved or printed goods who use our workflow as software, and regional factories that receive validated jobs.

Geography: Armenia first as production base and test market, then English-speaking online demand in the EU and the US with a partner factory in each region. Digital files sell worldwide from day one.

One hero product: the personalized acrylic LED light

Launch spec	Kept deliberately narrow
Input	A portrait, pet or home photo, plus optional name, date or message
Styles	Three visual styles with deterministic safe zones
Hardware	One acrylic thickness, one repairable base, two sizes
Light	Warm white or multicolor on one low-voltage power design
Approval	Buyer signs off a proof before anything is cut
Shipping	Flat, tested packaging with favorable dimensional weight

Around 370 paid orders, fulfilled offline before the platform launched

~370

Paid customer orders

All produced at our partner workshop in Armenia and sold through our own channels over the last two years.

~15 / mo

Personalized night lights

Steady for two years. About 360 units and 3.6M AMD (~\$9,300) in revenue.

~10

Banners and wall decor

Over the last six months, totalling 500,000 AMD (~\$1,300) in revenue.

The online platform went live in July 2026 and has not yet processed paid orders. Its first milestone is 100 paid orders from 3 countries within 90 days of funding.

WHY NOW

Design got cheap while cross-border parcels got expensive

Technology

Generative models can draft line art

Skilled design minutes per order fall, while machines are already digitally controlled.

United States · 29 Aug 2025

Duty-free de minimis suspended

Small parcels from every country now face duties on entry.

European Union · 1 Jul 2026

€3 duty per low-value item

The €150 customs exemption is gone for e-commerce imports.

Software that routes a validated job to a factory near the buyer becomes more valuable with every new border cost.

THE MARKET

Buyers already pay billions for made-to-order goods

TAM

~\$31B

Global personalized gifts, 2025

Third-party estimates cluster between \$28B and \$34B. The hardest public anchor is Etsy alone: about 30% of \$10.46B marketplace sales, or ~\$3.14B, is custom or made-to-order.

SAM

~\$1.5B

Our category, our regions

Personalized acrylic and wood lights, wall decor, toys and constructors sold online in Armenia, the EU and the US. Products that fit constrained templates, ship flat and carry customization margin.

SOM

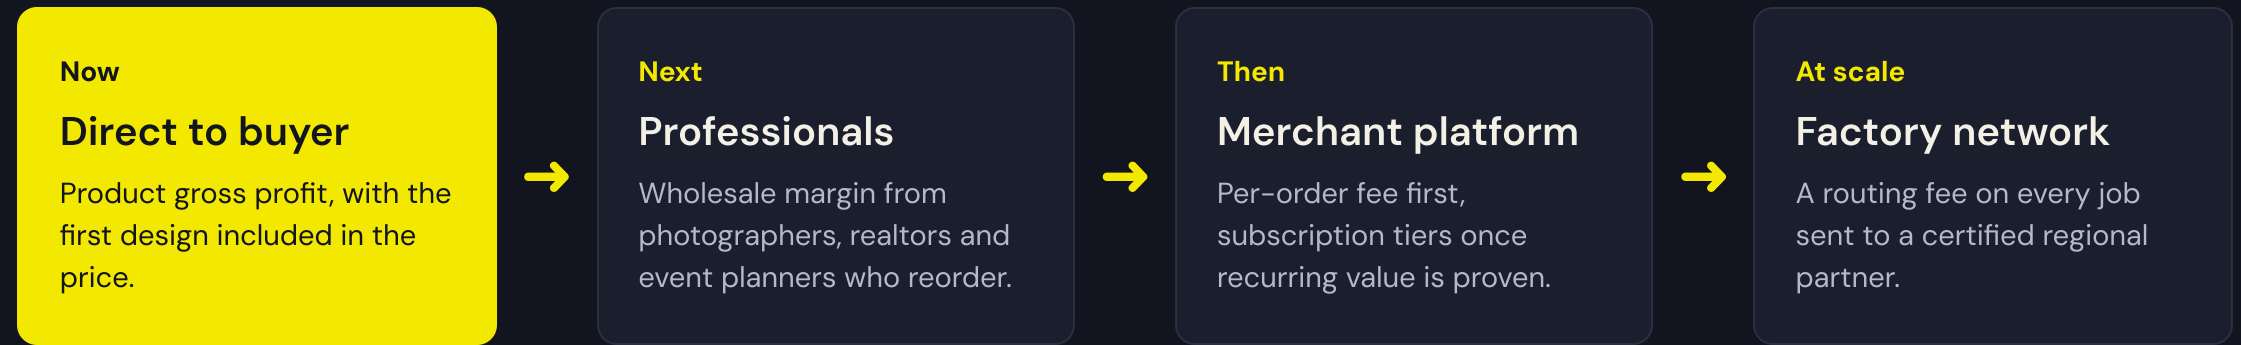

\$0.75M →
\$4M

Year one to year three

Year one: 10,000 orders of the hero product at a \$75 average order. Year three: add professional reorders, 1,000 merchants at \$149/month and a routing fee on partner-factory jobs.

Sources: Etsy 2025 Form 10-K; Technavio, SkyQuest and The Business Research Company personalized-gifts reports. SAM is a bottom-up estimate; SOM figures are targets, not forecasts.

Revenue arrives in a deliberate sequence

Alongside every stage: licensed digital files sold worldwide, with high margin and no freight.

Every order teaches the system how things really get made

Versioned templates

Geometry, tolerances, safe zones, parts lists and process rules per product.

Production outcomes

What was requested, generated, corrected, produced, remade and loved.

Factory capability

Machines, materials, calibration, cost, capacity and quality history by partner.

Closed-loop quoting

Estimates sharpen from real machine time, labor and remake data.

COMPETITION

Strong players own every layer except the join

Layer	Who is there	Where Uniqraft sits
Demand marketplaces	Etsy, Amazon Custom, Zazzle	We use them as launch channels and own the production workflow
Personalization software	Customily, Zakeke, Twikit	We go where personalization changes geometry, not artwork placement
Print-on-demand networks	Printful, Printify, Gelato	We integrate for commodity items and stay out of shirts and mugs
On-demand manufacturing	Ponoko, SendCutSend, Xometry	We own buyer and merchant intent plus the product templates
Maker ecosystems	xTool, Glowforge, Cricut	We route across machines and add the order and quality layer
The manual workflow	Canva, email and a local laser shop	We win on measured time to an approved order and fewer remakes

Asset-light from day one: we write the production package, partners execute it

Today

Partner workshop, Armenia

Not owned by us. Our co-founder runs production there with working access to 14 profiled machines. It has produced all ~370 orders to date.

Today

Local manufacturers

Electronics, bases and finishing are delegated to other Armenian shops per order. Our first live test of writing a package another shop can execute.

Next

One EU and one US partner

Formalize the Armenian workshop as the first certified producer of the hero product, then qualify a partner factory near buyers in each region.

Three lanes: global digital files and merchant software sold everywhere; standardized physical products made regionally; bespoke banners, furniture and metal kept local and quoted.

The gates we hold ourselves to

Metric	Go gate	Today · 23 Sep 2026
Paid orders	100+, from 3+ countries	~370 offline, 1 country; 0 online
Contribution margin	35% or more	Not yet measured per order
First-pass design approval	85% or more	Instrumentation ships with funding
Median human correction	Under 10 minutes	Instrumentation ships with funding
Remake and refund rate	Under 5%	Not yet measured
On-time dispatch	95% or more	Not yet measured
External partner, same product	95% to spec	Partner not yet certified

Two founders who cover the software and the factory floor

Hovhannes Baghdasaryan

Co-founder · Software engineer

Builds the platform: AI design generation, commerce, payments and the production review tools.

Vahe Nshanyan

Co-founder · Factory and manufacturing expert

Runs production at the partner workshop: machines, materials, production quality and partner factory standards.
